* Buzz is a measure of the strength of the communication about a stock. The value is always based on the average communication about the respective stock. Average is 100%.

** Sentiment represents the meaning of the content of messages, tweets and opinions of market participants on a stock. We indicate the sentiment on a scale of -100 to +100 points. -100 points means very negative and +100 very positive. A value of e.g. +70 points is above average and fairly positive.

Current development of TIXX

Important note: The Deutschland Top Aktien Index (TIXX) is not directly investable. UniCredit has issued an index certificate on the TIXX for investors. This allows everyone to participate in the performance of the innovative stock index. The index certificate on the TIXX with the security identification number HZ5UBV (ISIN DE000HZ5UBV2) can be bought and sold on the Stuttgart, Frankfurt and gettex (Munich) stock exchanges as well as in direct trading with UniCredit. Buy or sell orders for the index certificate on the TIXX are possible at any online broker as well as at all banks and savings banks. Please note the risk information as well as our disclaimer.

Appendix

Description

The Stockpulse Morning Briefing serves as daily information for the current discussion on stocks in social media and traditional news. Based on the analyses by Stockpulse using Emotional Data Intelligence, the top 10 titles (e.g. stocks, currency pairs, indices, crypto currencies or commodities) that are currently the focus of the discussion are displayed. The morning briefing is offered for different categories, e.g. the most discussed stocks in the past 24 hours (Top Buzz Stocks), the most positively or negatively discussed stocks (Top / Flop Sentiment), the most discussed stocks from special sources, e.g. on Reddit or discord (Top Buzz Reddit Stocks).

An important component of the Stockpulse Morning Briefing is the listing of the most important news about the top titles. There are five categories for which the news and posts are classified: traditional news, tweets, forum posts, chats and ad hoc messages. The subject, timestamp, headline, a snippet of the text (if available), the author and a link to the original message are displayed.

Glossary

Buzz: Buzz is a relative measure and indicates how much a title is discussed in the different sources or in a single source. News and posts are collected in real time and summarized / counted in different time units. The number of messages in a time unit is compared with the number of messages in the same time units from the previous days (on a daily basis it gets compared simply with the values from the previous days). For some, highly discussed titles, 1000 messages can be a lot, for others it can be very little. The buzz is given as a percentage and the average is 100%. A buzz value of e.g. 500% indicates that the title is currently being talked about 5 times more than the average.

Change in buzz: The change values for the buzz are given in percent and relate to the value of the previous day in the Stockpulse Morning Briefing, as daily values are always used in this report. A change value of e.g. 200% and a current buzz value of 750% means that the buzz value of the title was 250% the day before.

Sentiment: The sentiment indicates the direction of communication. Using Natural Language Processing (NLP) the texts are analyzed and sorted into positive and negative categories. Each text receives a numerical value that represents the sentiment. The sentiment is not binary, but contains a strength and can theoretically range from -infinite to +infinite. Since the sentiment values, like the buzz values, relate to the values from the same time periods of the previous days, it is a relative measure and usually fluctuates around 0. The sentiment is an absolute value and is not given as a percentage. We normalize the sentiment values in the Stockpulse Morning Briefing on a scale from -100 to +100 points. There can be strong fluctuations in both directions, depending on how many positive or negative messages per unit of time are recorded by a title.

Change in sentiment: The change values of the sentiment are given as absolute and normalized values. With a change value of +30 and a current sentiment value of -10, the sentiment for the title was -40 in the previous period. Normalized on a scale from -100 to +100 points.

Market sentiment: The market sentiment is given for the main indices of the relevant markets. Basically, the calculation and specification of the sentiment does not differ from the description of the sentiment above, only in relation to the individual indices. The indices specified in this category are, in part, selected dynamically, depending on the region. The Stockpulse Morning Briefing for the German market shows the most important German indices, for other countries the important indices of the country.

Important news: An important component of the Stockpulse Morning Briefing is the listing of the most important news about the top titles. There are five categories for which the news and posts are classified: traditional news, tweets, forum posts, chats and ad hoc messages. The subject, timestamp, headline, a snippet of the text (if available), the author and a link to the original message are displayed.

The importance of a message is determined by various criteria. There are manually verified users or authors whose messages are generally classified as "more important". Some sources have social interaction statistics, e.g. follower numbers, the date the account was created, number of friends, karma points, source-specific scores, etc. Based on these values, which are mostly source-specific, we favor messages from authors who receive a better overall score (Author Score) on this basis.
